ENVIRONMENT IMPACT ASSESSMENT REPORT

FOR DEVELOPMENT OF CIVIL ENCLAVE AT VILLAGE- KUTLUPUR & BISHAMBHARPUR, TEHSIL- BIHTA, DISTRICT- PATNA, BIHAR (43.84 HA)

PROJECT PROPONENT: AIRPORTS DIRECTOR JPNI AIRPORT, PATNA

Doc No. 10452019

REVISION NO: 01

ISSUE DATE:

29/08/2020

EXECUTIVE SUMMARY

INTRODUCTION

1. This chapter constitutes the summary of EIA report. It will provide for overall justification for implementation of the project and explains how the adverse effects of the proposed project are mitigated.

PROJECT BRIEF

2. The proposed project is IAF Airport at Bihta Airport is spread over an area of 108.4075 Acres. The proposed project falls in Category A of project activity 7(a) of the Schedule vide EIA notification 2006 amended to date involving preparation of Environment Impact Assessment study and Environment Management Plan. The development of Civil Enclave at IAF base, Bihta has been planned in view of near saturation of the existing airport in Patna where due to land / other constraints, there is no scope of further expansion of Terminal Building/air side capacity/extension of runway length.
3. The Bihta airport site is located 35 km from Patna near NH-922. The site is located in Bihta block, in Patna district, in the state of Bihar. The proposed site for the airport is located at latitude 25°35'59.45" N and longitude of 84°53'24.26" E.
4. AAI proposed to develop airport at Bihta, Patna district. In the A new terminal building for handling annual capacity of 2.5 MPPA in Phase-I and 5 MPPA ultimate capacities will be developed. The peak hour capacity will be 2000 PHP

DESCRIPTION OF ENVIRONMENT

5. The baseline data for the project was collected during the October to December, 2019, covering an area of 10 km radius from the project site. There are no National Parks, Wildlife Sanctuaries or Biosphere Reserves within the study area.
6. Geographical Setting: The project site lies in Seismic Zone IV which is a moderate damage risk zone. The existing land is a non-agricultural Government land on river bed. The elevation of the site is 52.403 mRL to 53.925 mRL.

7. **Soil Quality:** Soil samples were collected from 5 locations and analysis of the samples indicated that soil of the study area is of low fertility with low Phosphorus and Potassium content, and agricultural activity, if any, would be highly dependent on the addition of external fertilizers.
8. **Traffic Volume Count:** Traffic volume count done in 3 locations indicated that the level of service of all the roads was under Category B & C indicating free flow of traffic.
9. **Air Environment:** Air monitoring was done in 9 locations and the samples were analysed for particulate matter (PM₁₀ & PM_{2.5}), free silica and gaseous pollutants (SO₂, NO₂ and CO).
10. The 98 percentile concentration of PM₁₀ and PM_{2.5} varies from 60.6 µg/m³ (AAQ8) to 86.2 µg/m³ (AAQ4) and 25.0µg/m³ (AAQ6) to 46.3µg/m³ (AAQ4) respectively. The results of the monitored data indicate that concentration of Particulate Matter (PM₁₀) is well within prescribed limit of 100 µg/m³. The PM_{2.5} values are also well within the prescribed limit of 60 µg/m³. The maximum and minimum SO₂ concentrations were recorded as 19.5µg/m³ at AAQ4 and 12.1 µg/m³ at AAQ6. Whereas, the minimum concentration of 18.0µg/m³ for NO₂ was recorded at AAQ6 and maximum concentration of 27.9 µg/m³ was observed at AAQ4. The concentration of SO₂ and NO₂ was found well within prescribed NAAQ standards. The lowest level of CO was observed at AAQ9 (0.48 mg/m³) while the highest value (0.79 mg/m³) was observed at AAQ7. These levels are found to be well within the NAAQ standard of 2.0 mg/m³ for residential and industrial areas. These levels are found to be well within the NAAQ standard of 2.0 mg/m³ for residential and industrial areas.
11. **Noise Level Assessment:** Noise level was monitored in 11 locations and it was observed that the present noise level is not exceeding the standard level of CPCB norms. The Leq was recorded in the range of 50.1 to 62.9 dB(A) during daytime and 40.9 to 46.1 dB(A) during night time.
12. **Drainage Patten:** In the 10km study area of the project site. The district falls in the Ganga Basin and is drained by the mighty Ganga in the North, by the Sone in the West, and by the Punpun and their tributaries in the central part of the terrain.
13. **Water Quality:** To assess the water quality, surface water samples were collected from 4 locations and ground water samples were collected from 5 locations.

14. The guidelines by CPCB are set using few parameters in such a way that the best use of that particular quality of water for human utilization can be known. Analysing these parameters for the four locations, it was found that the overall class of water for individual samples comes as "C" which signifies that water of Son River can be used as a drinking water source after conventional treatment and disinfection.
15. Analysis of the ground water samples indicated that the ground water quality does not indicate any industrial contamination and meets the standards of IS 10050:2012 and therefore can be used for drinking purposes.
16. **Ecology:** Common Few trees are present which are going to be retained by AAI. Since there is no organised forest in the entire study area, trees are only found in patches. Mango (*Mangifera indica*), Imlu (*Tamarindus indica*), Gulmohar (*Delonix regia*), Peepal (*Ficus religiosa*), Jamun (*Syzygium cumini*), Guava (*Psidium guajava*) etc. are commonly found in the study area. Due to presence of two major rivers-Son and Ganga, the area act as habitat for variety of avifauna. The Danapur Cantonment area, which is around 15 km from the site, witnesses activities of birds, especially migratory birds like Asian Open Bill Storks and Siberian Cranes. As the place is restricted for outsiders, these birds find a safe haven and this flock the place each year. Apart from birds, no unique faunal community could be observed within the buffer zone of the project area, except common species like lizard, squirrel, monkeys, mongoose and domestic animals.
17. **Socio-economy:** There are 188 villages in the study area having a total population of 695995 out of which 366815 are males and 329180 are females as per Census of India 2011. The gender ratio of the project site has same 870 to 897 from 2001 to 2011. 6.9 % of the population in the study area is in SC category while 0.090 % is in ST category as per the 2011 Census. The female literacy rate was found to have increased from 32.51% in 2001 to 45.77% in 2011 in the study area. The percentage of non-workers is high (> 50%) in the study area as compared to the total workers. As far as educational facilities are concerned, the number of primary schools, numbers of middle school and secondary school has increased from 2001 to 2011. The number of senior secondary schools, however, has decreased. The medical facilities present in the study area do not seem to be appropriate to cater the population.

					authorized recyclers.
3	<p>Water Quality & Drainage: There are no streams passing through the project site.</p> <ul style="list-style-type: none"> The source of water for the proposed project will be Ground water. Surface water was monitored in 4 locations. The overall class of water for individual samples comes as "C" as per Designated Best Use of water as per CPCB which signifies the water of Son River can be used as a drinking water source after conventional treatment and disinfectant. Ground water was monitored in 5 locations. The samples indicated that 	<ul style="list-style-type: none"> The waste generation from the labour camps may find its way into natural water bodies thereby polluting them. The wastewater generation during site development and construction mainly includes the water run-off from the construction areas, stockpiles of construction materials and wastes, etc. mainly containing high suspended solids. The repair and maintenance of construction 	<ul style="list-style-type: none"> Wastewater generated from the domestic activities will be treated in septic tank followed by soak pit. A sediment trap will be provided to prevent the discharge of excessive suspended solids. To prevent contamination from spillage of oil, storage areas will be made by cemented floor, bunded and will be cleaned at regular intervals. Suitable drainage network would be made to ensure proper draining of wastewater from the construction sites. Used oil will be 	<ul style="list-style-type: none"> As airport has a fuel storage area in 8000 m², fuel leakage and spillage from refuelling may take place. These can either leach into ground water or can contaminate storm water run-off which can pollute nearby water sources. The total wastewater estimated to be generated in operation phase will be 665 KLD 	<ul style="list-style-type: none"> Proper oil & grease interceptors will be installed at outlet point of storm water drainage Based on waste water calculation, an STP of 700 KLD capacity shall be installed at the site. The capacity of the STP is far more than the estimated wastewater generation. The entire treated waste water shall be reused for various activities within the site.

ENVIRONMENT MONITORING PLAN

18. The Environment Monitoring Programme is required to ensure sustainable development in the region adjoining the project, hence it needs to be an all-encompassing plan for which the AAI, government, regulating agencies like State Pollution Control Board, MoEF&CC, etc. working in the region and more importantly the affected population of the study area need to extend their co-operation and contribution.
19. The monitoring team will be responsible for planning, execution and monitoring of all aspects of the environment based on the procedures laid out the guidelines of CPCB through various notifications, starting from start to closure of mines.

20. The Environment Monitoring Cost has been estimated to be INR 46,35,000 per year.

ADDITIONAL STUDIES

21. As per the conditions prescribed in the TOR and Para 7 & Appendix-IV of the EIA Notification 2006, public consultation shall be conducted by Regional Office of MPPCB based on Draft EIA report submitted to the State Pollution Control Board along with other relevant documents and additional studies.
22. The Based on the TOR specified by the Ministry of Environment, Forest and Climate Change (MoEF&CC) issued vide letter no. 10-45/2019-IA,III dated 05.12.2019 for preparation of EIA/EMP Report for proposed project, several studies were conducted to provide a clear picture of the project area. The studies and activities suggested in EIA Notification also includes:
- Public Hearing and Consultation
 - Risk Assessment Study and Disaster Management Plan

PROJECT BENEFITS

23. The proposed Airport development will enhance the safety, security and environmental standards and passenger comfort at Airport and also will help in catering to forecast future air traffic and passenger growth and national civil aviation vision.
24. Also, after proposed expansion of Terminal Building the aviation linked commercial development will evolve around airport including Basic Amenities, shopping plaza and office parks, hospitality industry, promotional activities of tourism, logistic park and housing.
25. There will be increased connectivity to the surrounding areas and will aid the economic development of the region. This will also increase various economical activities including the local industries and businesses, and would provide significant employment opportunities to the surrounding areas. Social and community infrastructure and services will be provided in response to the need of the local communities. The propose project will enhance the quality of life, equity, and social wellbeing through community support and awareness.

ENVIRONMENT IMPACT ASSESSMENT REPORTFOR DEVELOPMENT OF CIVIL ENCLAVE AT VILLAGE- KUTLUPUR & BISHAMBHARPUR, TEHSIL- BIHTA,
DISTRICT- PATNA, BIHAR (43.84 HA)**PROJECT PROPONENT: AIRPORTS DIRECTOR JPNI AIRPORT, PATNA**

Doc No. 10452019

REVISION NO: 01

ISSUE DATE:

29/08/2020

26. During the construction phase, employment opportunity to skilled, semi-skilled and unskilled persons will be provided. The construction contractors are likely to use unskilled labour drawn from local communities. It is anticipated that the construction labour inputs for the construction of the project will be mostly hired from the surrounding areas per day directly. Even during operation phase, significant numbers of persons will get direct and indirect employment opportunities.

ENVIRONMENT MANAGEMENT PLAN

27. The Environmental Management Plan (EMP) contains a description of proposed remedial measures and monitoring plan for the construction and operational period of the project. The EMP often covers construction / management guidelines that specifically address how the contractors are to incorporate environmental considerations into their work. EMP considers compensatory measures if mitigative measures are not feasible or cost-effective.
28. Waste management is an important facet of environment management. Thus, solid waste management is important from both aesthetics & environmental viewpoints.
29. The EMP cost has been calculated to be Rs. 9.60 Lakhs as capital cost and Rs. 2.94 lakhs as annual recurring cost in the construction phase and Rs. 68.75 Lakhs as capital cost and Rs. 12.20 lakhs as annual recurring cost in the operation phase.
30. The CER cost is estimated to be INR 950.76 lakhs.
